# Inventory check updates stopped working in the background

**Environment**: Production

**The problem:**  Duplos'  16<sup>th</sup> Feb hotfix deployment caused a CRON job to be not starting automatically.

The hotfix deployment was to do with - bulk insertion of WO from an excel, which triggers another service to do this.

While adding the service, the CRON job type also needs to be passed since both are going into a common code which trigger service/cron.

The Cron job type was missed and hence the Cron Job stopped working, which used to check the inventory updates in the background.

**The short term fix:**  The fix is to properly pass "cron" & "service" to the method so that both job gets scheduled properly.

**The long term fix:**  The fix is to properly pass "cron" & "service" to the method so that both job gets scheduled properly.

**Systemic Solution: UnitTest/QA test/ Regression/ Automation/  - Could have been caught in Code Review or Regression Testing**

**Gatekeeper**: Developer, Reviewer, QA

**Safety Net:** Add inventory update check also as part of regression/sanity checks
